NEW IN CHATGPT

ChatGPT now builds working tools in chat

Since 7 October, answers can include calculators, forms and charts. Here are five tools we would ask it for first, and the catch.

SWIPE ››

01 / 06

A quote calculator

Give it your hourly rate, materials markup and VAT, and ask for a calculator with boxes for hours and materials. Change the inputs per job instead of redoing the sum each time.

> START WITH
>
> **Ask: 'Build a quote calculator: hours x my rate, materials plus 15% markup, then 20% VAT.'**

02 / 06

A break-even calculator

Enter your fixed costs, your price and your cost per sale. It shows how many sales you need before you make a penny. Slide the price up and down and watch the number move.

START WITH

Ask: 'Build a break-even calculator with sliders for price and monthly fixed costs.'

A supplier quote comparison

Paste in three supplier quotes and ask for a side-by-side table with the total cost over twelve months, including delivery and any minimum order. The cheapest headline price is not always the cheapest.

START WITH

Ask: 'Compare these three quotes over 12 months, including delivery. Flag anything missing.'

04 / 06

A 12-week cash chart

Type in expected money in and bills going out each week and ask for a chart. Weeks where the line dips below zero are the ones to sort out now, not on the day.

START WITH

Ask: 'Chart my cash week by week for 12 weeks from these inputs, and flag any dip below zero.'

An enquiry form that asks your questions

Every new enquiry gets the same five questions from you. Ask for a form that captures them, so you can fill it in on the call and read back a clean summary at the end.

START WITH

Ask: 'Build a form for new enquiries: name, job type, address, timing, budget. Then summarise it.'

06 / 06

Then check the sum before you trust it

Commentators have already warned that a tool built on the spot can still get the maths wrong. Run a job you have already priced through it. If the answer differs from yours, fix the prompt. Keep customer details out.

START WITH

Test every new tool on one job where you already know the right answer.

Ask it for the tool. Check the sum.

This is the list we would try first, tested against a job we had already priced. Which plans get it, and exactly how it behaves, is still settling, so try it on yours.

Which sum do you redo most often that a little tool like this could do for you?
