CASE STUDY

We planned a home extension in a week with Claude

Plans in 2D and 3D, a tracker and a builder tender pack, from one tool. Here is what it does and what we cannot claim yet.

01 / 06

The problem

On past developments the big costs came from unexpected add-ons, not the work we priced. A changed layout, a missing socket, a wall that moved once the builder was on site.

START WITH

List the last three surprise costs on any job you have run. Which decision, made earlier, would have avoided each?

02 / 06

What we built

Floor plans in 2D with a live 3D model, a view of each wall for sockets and lights, and a tracker for budget, programme, materials and payments. One tool, built with Claude only.

START WITH

Describe the tool you wish you had in plain English. That description is your first prompt.

Plan and 3D, side by side

Edit the floor plan on the left and the 3D model updates on the right.

The house in 3D

Orbit round it, hide the floors above, check what the extension will look like.

The plan in 2D

Walls, rooms, doors, plus every socket, switch and light placed before the builder arrives.

One version of the truth

Everyone involved, from trades to contractors, works from the same drawings and numbers, not three versions in three inboxes. Fewer misunderstandings means fewer paid-for mistakes.

> START WITH
>
> **Pick one place where the current plan lives. Retire every other copy.**

04 / 06

The tender pack

A detailed pack, generated from the design, goes to every builder, so they all price the same job. Three quotes have come back from it.

START WITH

Ask each builder for a written, itemised quote and read the exclusions first.

Time to build

About a week, with Claude as the only tool. It is built for one personal development project, not a product we sell.

> START WITH
>
> **Build the smallest version that answers your biggest worry, then add to it.**

What we are not claiming

We have not measured a saving, and we will not invent one. So far: one set of plans, one tender pack and three quotes. It does not replace an engineer or a measured survey.

START WITH

Keep a contingency anyway. Which? and others suggest around 10 to 15 per cent.

Decide early. Price the same job.

This is our own project, built for ourselves. Results are ours and will vary for your business and your build.

Which job in your business would be cheaper if every decision were made before the work started?
